Take note of safety instructions for Ex applications

Please note the Ex specific safety information which you will find on our homepage www.krohne-mar.com and which come with the appropriate instrument. In hazardous areas you should take note of the appropriate regulations, conformity and type approval certificates of the sensors and power supply units. The sensors must only be operated on intrinsically safe circuits. The permissible electrical values are stated in the certificate.
1 Description of the measuring principle

Measuring principle
OPTISWITCH is a level sensor with tuning fork for level detection. It is designed for industrial use in all areas of process technology and is preferably used for bulk solids.

The vibrating element (tuning fork) is energized piezoelectrically and vibrates at its mechanical resonance frequency. The piezos are fixed mechanically and are hence not subject to temperature shock limitations. If the vibrating element is submerged in the product, the vibrating amplitude changes. This change is detected by the integrated oscillator and converted into a switching command.

Typical applications are overfill and dry run protection. Thanks to its simple and robust measuring system, OPTISWITCH is virtually unaffected by the chemical and physical properties of the bulk solid.

It functions even when exposed to strong external vibration or changing products.

Fault monitoring
The electronics of OPTISWITCH continuously monitors the following criteria:

- Correct vibrating frequency
- Line break to the piezo drive

If one of the stated malfunctions is detected or in case of power failure, the electronics takes on a defined switching condition, e.g. the relay deenergis (safe condition).

Solid detection in water
With the OPTISWITCH (3100 C, 3200 C, 3300 C) version for solid detection in water (option), the vibrating element is adjusted to the density of water. If submerged in water (density 1 g/cm³), OPTISWITCH signals "uncovered". Only if the vibrating element is also covered with solids (e.g. sand, sludge, etc.) will the sensor signal "covered".

OPTISWITCH 3100 C, 3200 C, 3300 C
OPTISWITCH 3100 C, 3200 C and 3300 C level switches are available in standard, cable and tube version and, thanks to the large array of process fittings, offer the optimal solution for any application. They are completely manufactured of stainless steel and have all standard approvals.

OPTISWITCH are virtually unaffected by product properties and must hence not be adjusted.

The level switches can be used in applications with process temperatures up to 250 °C (482 °F) and pressures of up to 16 bar (232 psi).

You can detect bulk solids up to >0.008 g/cm³ (0.0003 lbs/in³).

OPTISWITCH 3000 C
OPTISWITCH 3000 C differs from the OPTISWITCH 3100 C, 3200 C and 3300 C level switches in its simple process fitting of plastic and the limited selection options. It is suitable for bulk solids from >0.08 g/cm³ (0.003 lbs/in³).
Building material industry

Fig. 2: Silo for aggregate in the building material industry

Cement or aggregates are placed in interim storage in multiple chamber silos. When the chambers are filled, large quantities of dust are generated. Depending on the consistency of the aggregate, different material cones are formed and the product properties can change from filling to filling.

OPTISWITCH offers additional protection against overfilling the aggregate silo. The flexible suspension cable avoids mechanical strain caused by movements of the bulk solid. A filling is not necessary for setup. Because OPTISWITCH has practically no moving parts, it is not subject to wear.

Advantages:
- very rugged tuning fork
- High abrasion resistance
- insensitive to buildup
- Setup without filling
## 2 Type overview

**OPTISWITCH 3100 C**
- Preferred application: Solids
- Length: 0.3...80 m (1...262 ft)
- Process fitting: Thread G1½A, flanges
- Process temperature: -50...+150 °C (-58...+302 °F)
- Process pressure: -1...16 bar/-100...1600 kPa (-14.5...232 psi)
- Signal output: Relay, transistor, two-wire output, contactless electronic switch
- Ruggedness: ++
- Sensitivity: ++
- Buildup: ++
- Installation length: +

**OPTISWITCH 3200 C**
- Preferred application: Solids
- Length: 0.3...6 m (1...20 ft)
- Process fitting: Thread G1½A, flanges
- Process temperature: -20...+80 °C (-4...+176 °F)
- Process pressure: -1...6 bar/-100...600 kPa (-14.5...87 psi)
- Signal output: Relay, transistor, two-wire output, contactless electronic switch
- Ruggedness: ++
- Sensitivity: ++
- Buildup: ++
- Installation length: +

**OPTISWITCH 3300 C**
- Preferred application: Solids
- Length: 0.3...6 m (1...20 ft)
- Process fitting: Thread G1½A, flanges
- Process temperature: -50...+150 °C (-58...+302 °F)
- Process pressure: -50...+250 °C (-58...+482 °F)
- Signal output: Relay, transistor, two-wire output, contactless electronic switch
- Ruggedness: ++
- Sensitivity: ++
- Buildup: ++
- Installation length: +

**OPTISWITCH 3000 C**
- Preferred application: Solids
- Length: -
- Process fitting: Thread G1½A
- Process temperature: -50...+100 °C (-58...+212 °F)
- Process pressure: -1...6 bar/-100...600 kPa (-14.5...232 psi)
- Signal output: Relay, transistor, two-wire output, contactless electronic switch
- Ruggedness: +
- Sensitivity: -
- Buildup: ++
- Installation length: +
Housing
- Plastic
- Stainless steel
- Aluminium

Electronics
- Relay output
- Transistor output
- Contactless electronic switch
- Two-wire output
- NAMUR output

Sensors
- Tuning fork

Approvals
- Gas explosion protection
- Dust explosion protection
3 Mounting instructions

Switching point
In general, OPTISWITCH can be mounted in any position. The instrument must be mounted in such a way that the vibrating element is at the height of the requested switching point.

The only exception is the mounting of the tuning fork vertically from the bottom. In this position it can happen that product sticks between the fork tines.

Socket
The vibrating element should protrude into the vessel to avoid buildup. For that reason, avoid using mounting bosses for flanges and screwed fittings. This applies particularly for horizontal installation and with adhesive products.

Filling opening
Install the instrument in such a way that the vibrating element does not protrude directly into the filling stream. Should such an installation location be necessary, mount a suitable baffle above or in front of the vibrating element, e.g. L80x8 DIN 1028 (see Fig. Part "a."). In abrasive solids, mounting according to fig. Part "b.", has proven to be a good solution. The mound that forms in the concave baffle protects it from abrasion.

Horizontal installation
To achieve a very precise switching point, you can install OPTISWITCH horizontally. However, if the switching point can have a tolerance of a few centimeters, we recommend mounting OPTISWITCH approx. 20° inclined to the vessel bottom to avoid buildup.

Material cone
In silos containing solids, material cones can form which change the switching point. Please keep this in mind when installing the sensor in the vessel. We recommend selecting an installation location where the vibrating element detects an average value of the material cone.

Inflowning medium
If OPTISWITCH is mounted in the filling stream, unwanted switching signals may be generated. Mount OPTISWITCH at a location in the vessel where no disturbing influence from e.g. filling openings, agitators etc. can occur.
This measure applies particularly to applications in Ex areas. Make sure that the tube is not subjected to bending forces through this measure.

Should the installation from top be necessary, check if you can use a cable version.

In the long run, strong vibrations can damage the instrument electronics. With a remote housing these can be disconnected from the process.

**Flows**
To minimise flow resistance caused by the tuning fork, OPTISWITCH should be mounted in such a way that the surfaces of the blades are parallel to the product movement.

**Lock fitting**
OPTISWITCH in tube version can be mounted with a lock fitting for height adjustment. Take note of the pressure specifications of the lock fitting.

**Baffle protection against falling rocks**
In applications such as grit chambers or settling basins for coarse sediments, the vibrating element must be protected against damage with a suitable baffle.

**Pressure/Vacuum**
The process fitting must be sealed if there is gauge or low pressure in the vessel. Check if the seal material is resistant against the measured product and the process temperature.
4 Electrical connection

4.1 Preparing the connection

Note safety instructions
Generally note the following safety instructions:
- Connect only in the complete absence of line voltage
- Take note of safety instructions for Ex applications

In hazardous areas you should take note of the appropriate regulations, conformity and type approval certificates of the sensors and power supply units.

Select power supply
Connect the power supply according to the following diagrams. Oscillators with relay output and contactless electronic switch are designed in protection class 1. To maintain this protection class, it is absolutely necessary that the ground conductor be connected to the internal ground terminal. Take note of the general installation regulations. As a rule, connect OPTISWITCH to vessel ground (PA), or in case of plastic vessels, to the next ground potential. On the side of the housing there is a ground terminal between the cable entries. This connection serves to drain off electrostatic charges. In Ex applications, the installation regulations for hazardous areas must be given priority.

The data for power supply are stated in the “Technical data” in the “Supplement”.

Selecting connection cable
The instrument is connected with standard cable with round cross section. An outer cable diameter of 5 ... 9 mm (0.2 ... 0.35 in) ensures the seal effect of the cable gland.

If cable with a different diameter or wire cross section is used, exchange the seal or use an appropriate cable connection.

In hazardous areas, only use approved cable connections for OPTISWITCH.

Select connection cable for Ex applications

Take note of the corresponding installation regulations for Ex applications.

4.2 Wiring plan

Relay output
We recommend connecting OPTISWITCH in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

The relays are always shown in non-operative condition.

Transistor output
We recommend connecting OPTISWITCH in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

The instrument is used to control relays, contactors, magnet valves, warning lights, horns as well as PLC inputs.
Contactless electronic switch

We recommend connecting OPTISWITCH in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

The contactless electronic switch is always shown in non-operative condition.

The instrument is used for direct control of relays, contactors, magnet valves, warning lights, horns etc. It must not be operated without an intermediately connected load, because the electronics would be destroyed if connected directly to the mains. It is not suitable for connection to low voltage PLC inputs.

Domestic current is temporarily lowered below 1 mA after switching off the load so that contactors, whose holding current is lower than the constant domestic current of the electronics, are reliably switched off.

When OPTISWITCH is used as part of an overfill protection system according to WHG, also note the regulations of the general type approval.

Two-wire output

We recommend connecting OPTISWITCH in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

For connection to an SU 501 signal conditioning instrument dto. Ex. The sensor is powered by the connected signal conditioning instrument. Further information is available in chapter "Technical data" in the "Supplement", "Ex-technical data" are available in the supplied "Safety information manual".

Take note of the operating instructions manual of the signal conditioning instrument. Suitable signal conditioning instruments are listed in chapter "Technical data".

NAMUR output

For connection to an amplifier according to NAMUR (IEC 60947-5-6, EN 50227). For further information see chapter "Technical data".

Vibration – Level detection of bulk solids
5 Operation

5.1 Adjustment, general

Recurring function test
The recurring test according to IEC 61508 can be carried out by pushing the simulation key on the oscillator or by briefly (>2 seconds) interrupting the supply to the sensor. The correct sequence of the switching conditions must be monitored via the switching amplifier as well as the connected systems. The sensor must neither be removed nor a response triggered by filling the vessel. You can carry out the function test with the outputted current values also directly via a safety PLC or a process control system.

Simulation key on the electronics module
OPTISWITCH has an integrated simulation key. The simulation key is lowered on the electronics module. Push the simulation key for >2 seconds.

If OPTISWITCH is connected to an SPLC, you have to interrupt the connection cable to the sensor for >2 seconds.

After releasing the simulation key or briefly interrupting the connection cable to the sensor, you can check the complete measuring system on correct function. A switching procedure is simulated during the test.

Switching point adaptation (1)

You can adapt the switching point of OPTISWITCH to the solid with the potentiometer. The switching point is preset and covered by a label. It must only be modified in special cases.

OPTISWITCHes with tuning fork are preset to a product density of >0.02 g/cm³ (0.0007 lbs/in³). In very light solids, turn the potentiometer to complete left position 0.008 ... 0.1 g/cm³ (0.0003 ... 0.0036 lbs/in³). By doing this, the tuning fork will be more sensitive and can detect very light solids, such as e.g. Aerosils more reliably.

OPTISWITCH 3000 C

OPTISWITCH 3000 C can detect bulk solids from a product density of >0.08 g/cm³ (0.003 lbs/in³).

Mode adjustment (2)

With the mode adjustment (min./max.) you can change the switching condition of the output. You can set the required mode (max. - max. detection or overfill protection, min. - min. detection or dry run protection).

Signal lamp (5)

Diode for indication of the switching status.

5.2 Recurring function test - NAMUR electronics

According to IEC 61508.

SIL

OPTISWITCH is qualified in mode A (overfill protection) for use in measuring chains of stage SIL2 according to IEC 61508 (redundant, stage SIL3).

You find the “Safety Manual” with detailed specification on SIL on our website.

Recurring function test - Two-wire electronics

According to IEC 61508.

SIL

OPTISWITCH in conjunction with a suitable signal conditioning instruments is qualified in mode A (overfill protection) for use in measuring chains of stage SIL2 according to IEC 61508 (redundant, stage SIL3).

You find the “Safety Manual” with detailed specification on SIL on our website.

Recurring function test

The recurring test according to IEC 61508 can be carried out by pushing the test key on the signal conditioning instrument or by briefly (>2 seconds) interrupting the supply to the sensor. The correct sequence of the switching conditions must be monitored via the two LEDs on the signal conditioning instrument as well as the connected systems. The sensor must neither be removed nor a response triggered by filling the vessel.

Fig. 16: Adjustment elements electronics module, e.g. relay output (VB60R)
1 Potentiometer for switching point adaptation (not with OPTISWITCH 3000 C)
2 DIL switch for mode adjustment
3 Ground terminal
4 Screwed terminals
5 Control lamp

Fig. 17: Flow chart of the function test
1 Full signal
2 Empty signal

Check if all the switching conditions occur in the correct sequence and the stated time period. If this is not the case, there is a fault in the measuring system. Keep in mind that connected instruments are activated during the function test. This allows you to check the correct function of the measuring system.
You can carry out the function test with the outputted current values also directly via a safety PLC or a process control system. The implementation and switching sequence of the function test is described also in the operating instructions manual of the appropriate signal conditioning instrument.

**Test key on the signal conditioning instrument**
The signal conditioning instrument has an integrated test key. The test key is lowered in the front plate of the signal conditioning instrument. Push the test key with a suitable object (e.g. screwdriver, pen etc.) for >2 seconds.

If OPTISWITCH is connected to an SPLC, you have to interrupt the connection cable to the sensor for >2 seconds.
After releasing the test key or interrupting the connection cable to the sensor, the complete measuring system can be checked on correct function. The following operating conditions are simulated during the test:
- Fault signal
- Empty signal
- Full signal

![Flow chart of the function test](image)

*Fig. 18: Flow chart of the function test*

1. Full signal
2. Empty signal

Check if all the switching conditions occur in the correct sequence and the stated time period. If this is not the case, there is a fault in the measuring system. Keep in mind that connected instruments are activated during the function test. This allows you to check the correct function of the measuring system.
6 Technical data

General data
Material 316L corresponds to 1.4404 or 1.4435

OPTISWITCH 3000 C
Materials, wetted parts
- Process fitting - thread PBT
- vibrating element 316L/318S13 (1.4462)
Materials, non-wetted parts
- Housing plastic PBT (Polyester)
- Seal ring between housing and housing cover Silicone
- Ground terminal 316T/316L
Weight 1150 g (40 oz)
Max. lateral load 600 N (135 lbf)

OPTISWITCH 3100 C
Materials, wetted parts
- Process fitting - thread 316L

Weights
- OPTISWITCH 3200 C with plastic housing 1500 g (53 oz)
- OPTISWITCH 3200 C with Aluminium housing 1950 g (69 oz)
- OPTISWITCH 3200 C with stainless steel housing 2300 g (81 oz)
- Suspension cable approx. 165 g/m (1.8 oz/ft)
Max. permissible tensile load 3000 N (675 lbs)
Sensor length 0.3 … 80 m (1 … 262 ft)

OPTISWITCH 3300 C
Materials, wetted parts
- Process fitting - thread 316L
- Process fitting - flange 316L
- Seal Klingersil C-4400
- vibrating element 316L
- Extension tube (OPTISWITCH 3300 C) ø 43 mm (1.7 in) 316L
Materials, non-wetted parts
- Housing Plastic PBT (Polyester), Alu die-casting powder-coated, 316L
- Seal ring between housing and housing cover NBR (stainless steel housing), silicone (Alu/plastic housing)
- Ground terminal 316T/316L
### Weights
- OPTISWITCH 3300 C with plastic housing: 1500 g (53 oz)
- OPTISWITCH 3300 C with Aluminium housing: 1950 g (69 oz)
- OPTISWITCH 3300 C with stainless steel housing: 2300 g (81 oz)
- Extension tube (OPTISWITCH 3300 C) ø 43 mm (1.7 in): approx. 2000 g/m (21.5 oz/ft)

### Sensor length
0.3 ... 6 m (1 ... 20 ft)

### Max. lateral load
- OPTISWITCH 3300 C: 290 Nm (214 lbf ft), max. 600 N (135 lbf)

### Output variable

#### Relay output
- Output: relay output (DPDT), 2 floating spdts
- Turn-on voltage: 10 mV
- Switching current: 10 µA
- Breaking capacity: 1250 VA, 50 W
- Contact material (relay contacts): AgCdO and Au plated
- Modes (adjustable): min./max.
- Delay time:
  - when immersed: approx. 0.5 s
  - when laid bare: approx. 1 s

#### Transistor output
- Output: floating transistor output, overload and permanently shortcircuit proof
- Load current: max. 400 mA
- Turn-on voltage: max. 55 V DC
- Blocking current: <100 µA
- Modes (adjustable): min./max.
- Delay time:
  - when immersed: approx. 0.5 s
  - when laid bare: approx. 1 s

#### Contactless electronic switch
- Output: Contactless electronic switch
- Modes (adjustable): min./max.
- Delay time:
  - when immersed: approx. 0.5 s
  - when laid bare: approx. 1 s

#### Two-wire output
- Output: Two-wire output
- Suitable signal conditioning instruments: SU 501
- Mode min.
- Mode max.
- Fault signal
- Modes (adjustable): min./max.
- Delay time:
  - when immersed: approx. 0.5 s
  - when laid bare: approx. 1 s

#### NAMUR output
- Output: Two-wire NAMUR output
